➤

see the mainstream media taking a position and criticizing the poor result of chemotherapy and the high-cost treatments, which often are useless.

In France the pharmaceutical product Mediator, manufactured by the laboratory Servier, killed around 1500 people, made thousands more very ill, and some may still die. Did you hear that any responsible parties had been arrested? Of course not, and the owners can sleep well at night without any problem. Therefore it's easy for us to really understand that in the case of Ukrain where nobody dies, nobody complains, yet through our silence we are assisting a real premeditated plot. Recalling the example of Beljankski, he was able to dramatically help President Francois Mitterand with his case of advanced prostate cancer, but 18 months after Mitterand's death, Beljanski's operation was shut down and he was relentlessly persecuted.

According to the Austrian authorities, Ukrain ampoules were deemed totally ineffective against cancer. How do they really know? According to them, for the past 30 years cancer patients were mistaken. How very strange, because for the past 30 years many reputed European doctors, some directing clinics and hospitals, were using Ukrain with excellent results, including my own clinical experience of 25 years working with Ukrain. This seems strange for a drug that has been approved as standard anticancer medication in several countries in Europe and Asia (since 1998, the United Arab Emirates, Mexico, Georgia, Belarus). Ukrain had also been designated as an orphan drug for pancreatic cancer in US (#03-1693) and in Australia (File #004/009834).

How peculiar for a drug to be taken off the market that had been tested against 60 lines of human cancer cells at the National Cancer Institute (US) showing growth inhibition. Over 250 scientific papers were written and published, demonstrating the efficacy of Ukrain as a support for chemotherapy, describing how Ukrain selectively targets and kills cancer cells.

Ukrain used in large doses offers selective cytotoxic effect to cancer cells when administered to tumor patients by IV injection.[6] Ukrain usually hardens the consistency of the tumor and demarcates it from the surrounding tissue. The observation by laser-scanner microscopy reveals that a higher Ukrain uptake can be seen in a cell nucleus of a malignant cell compared with a normal cell.

Chief oncologist Joseph Brenner visiting my clinic from Israel.

In fact this discovery is of paramount importance, since we have for the first time a drug that can selectively kill cancer cells, but not healthy cells. For this reason, Nowicky was nominated for this great scientific feat, along with his research group for the 2007 Nobel Prize in Chemistry. Professor Leonid I. Nefyodov, PhD, MD, Dhc, department head of biochemistry (and laboratory), Yanka Kupala State University of Grodno (Belarussia), chairman of Belarusian Biochemical Society, submitted the nomination. Nefyodov was personally appointed by the Royal Swedish Academy of Sciences, Nobel Committee for Chemistry to nominate candidates.

Unfortunately, as we may imagine, such discoveries cannot be accepted, being in direct competition with medical dogma and multinational pharmaceutical laboratories. According to Nefyodov and many other scientific researchers, the Nobel Academy is not totally transparent in how it chooses new candidates. Being nominated for the Nobel Prize in Chemistry is in itself a prestigious scientific honor. The Austrian authorities, who jailed this researcher with the intention of destroying his work, never even took this into consideration.

Paradoxically, many well-known highly regarded doctors who treat cancer are conducting clinical tests with Ukrain on different types of cancer and especially pancreatic cancer, which is one of the worst and most dangerous cancers with a 2% to 3% survival rate of 5 years. For the moment, Ukrain is no longer available even for research. This is pending an upcoming court decision.

Among these well-known doctors are F. Gansauge, and B. Aschloff. They made several reports and published a number of clinical experiences.[7,8] Both doctors, practicing in Germany, are specialists in the treatment of cancer and especially pancreatic cancer with Ukrain.[9] They have demonstrated results with pancreatic cancer patients treated with chemotherapy with Ukrain showing significant increase in survival rates compared with chemotherapy alone.

Recently both Gansauge and Aschloff went to Vienna to show the authorities their research and work, but had no success in having Ukrain released, confirming my opinion that they were facing a very difficult situation. I am really wondering if the Austrian authorities really do care for the lives of dying cancer patients, knowing they are in a desperate state of suffering, or are they just "following orders"?

Berger et al. at the University of Ulm, Germany, treated 90 patients with advanced pancreatic cancer who were divided into 3 groups. Group A received gemicitabine 1000 mg/m2, group B received 20 mg Ukrain, and group C received 1000 mg/m2
